

# Case Study

## Victoria Police Centre, Melbourne

# Modular Access Platforms

## Bridging the gap for lift maintenance

### Project

Victoria Police Centre, Melbourne VIC

### Installer

Schindler Lifts Aust

### Products

KOMBI Modular Access Platforms

### Situation

A recently completed 40-storey tower in Melbourne's busy CBD, the new headquarters for Victoria Police, required access to a number of lift machines. Space was very tight and access to machinery at various heights meant specifically designed configurations were required.

The system was not able to be either craned or located into position with the use of heavy lifting equipment so lightweight components that could be manually carried in via the lift system needed to be sourced.

### Solution

SAYFA worked closely with Schindler Lifts to design custom access platforms to fit around each lift machine stand.

The designs were quite complex due to the variation in available space and multiple configurations that were required. One of the machine rooms was particularly challenging. A mezzanine had been fitted to each side of the room but access was only possible via one side. The design of a bridge which could span across from one side now gives workers access to all machinery.

SAYFA provided detailed shop drawings to Schindler, drafting them in the KOMBI Builda. This enabled a quick custom design that could be visualised easily by the client.

Schindler decided to use their own team to install the stairs and platforms. All components were transported up to the machine rooms via lifts and then assembled in situ. Installation could be done using basic power tools with any last minute modifications made utilising the patented KOMBI-Bolt.

We now have two extremely satisfied customers who couldn't believe the ease at which the whole project was completed.
